

Bright Coffee Shop Sales Analysis

Project Description

Bright Coffee Shop Sales Analysis is a business intelligence project that analyses transactional sales data to help management understand business performance and make data-driven decisions. The project focuses on identifying top-performing products, analysing customer purchasing patterns, evaluating sales trends over time, and uncovering opportunities to improve revenue.

Using **Databricks SQL**, the data was cleaned, transformed, and analysed before being visualised in **Power BI** through interactive dashboards. These dashboards enable users to explore key performance indicators, monitor sales performance, and gain actionable insights into customer behaviour and product performance.

The project demonstrates practical skills in data cleaning, SQL querying, data visualisation, dashboard design, business analysis, and storytelling with data, providing recommendations that support better inventory management, staffing decisions, marketing strategies, and overall business growth.

Project Objectives

- Analyse overall sales performance.
- Identify the products generating the most revenue.
- Determine the busiest times and days for customer purchases.
- Analyse sales trends across products and time periods.
- Create interactive dashboards for business decision-making.
- Provide data-driven recommendations to improve sales performance.
